# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### LCD operation

In recent years the LCD is finding widespread use replacing LEDs (seven segment LEDs or other multi segment LEDs). This is due to the following reasons:

1. The declining prices of LCDs.
2. The ability to display numbers, characters, and graphics. This is in contrast to LEDs, which are limited to numbers and a few characters.
3. Incorporation of a refreshing controller into the LCD, thereby relieving the CPU of the task of refreshing the LCD. In contrast, the LED must be refreshed by the CPU (or in some other way) to keep displaying the data.
4. Ease of programming for characters and graphics.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### LCD pin descriptions

The LCD discussed in this section has 14 pins. The function of each pin is given in Table 12-1. Figure 12-1 shows the pin positions for various LCDs.

**$V_{CC}$ ,  $V_{SS}$  and  $V_{EE}$**

While  $V_{CC}$  and  $V_{SS}$  provide +5 V and ground, respectively,  $V_{EE}$  is used for controlling LCD contrast.

**Table 12-1: Pin Descriptions for LCD**

Pin	Symbol	I/O	Description
1	$V_{SS}$	--	Ground
2	$V_{CC}$	--	+5 V power supply
3	$V_{EE}$	--	Power supply to control contrast
4	RS	I	RS = 0 to select command register, RS = 1 to select data register
5	R/W	I	R/W = 0 for write, R/W = 1 for read
6	E	I/O	Enable
7	DB0	I/O	The 8-bit data bus
8	DB1	I/O	The 8-bit data bus
9	DB2	I/O	The 8-bit data bus
10	DB3	I/O	The 8-bit data bus
11	DB4	I/O	The 8-bit data bus
12	DB5	I/O	The 8-bit data bus
13	DB6	I/O	The 8-bit data bus
14	DB7	I/O	The 8-bit data bus

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### *RS, register select*

There are two very important registers inside the LCD. The RS pin is used for their selection as follows.

If  $RS = 0$ , the instruction command code register is selected, allowing the user to send commands such as clear display, cursor at home, and so on.

If  $RS = 1$  the data register is selected, allowing the user to send data to be displayed on the LCD.

**Table 12-1: Pin Descriptions for LCD**

Pin	Symbol	I/O	Description
1	$V_{SS}$	--	Ground
2	$V_{CC}$	--	+5 V power supply
3	$V_{EE}$	--	Power supply to control contrast
4	RS	I	RS = 0 to select command register, RS = 1 to select data register
5	R/W	I	R/W = 0 for write, R/W = 1 for read
6	E	I/O	Enable
7	DB0	I/O	The 8-bit data bus
8	DB1	I/O	The 8-bit data bus
9	DB2	I/O	The 8-bit data bus
10	DB3	I/O	The 8-bit data bus
11	DB4	I/O	The 8-bit data bus
12	DB5	I/O	The 8-bit data bus
13	DB6	I/O	The 8-bit data bus
14	DB7	I/O	The 8-bit data bus

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### R/W, read/write

R/W input allows the user to write information to the LCD or read information from it.  $R/W = 1$  when reading;  $R/W = 0$  when writing.

### E, enable

The enable pin is used by the LCD to latch information presented to its data pins.

When data is supplied to data pins, a high-to-low pulse must be applied to this pin in order for the LCD to latch in the data present at the data pins. This pulse must be a minimum of 450 ns wide.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### D0-D7

The 8-bit data pins, D0-D7, are used to send information to the LCD or read the content of the LCS's internal registers.

To display letters and numbers, we send ASCII codes for letters A-Z, a-z, and numbers 0-9 to these pins while making RS=1.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### LCD Command Codes

These commands can be sent to the LCD to clear the display or force the cursor to the home position or blink the cursor.

**Table 12-2: LCD Command Codes**

Code (Hex)	Command to LCD Instruction Register
1	Clear display screen
2	Return home
4	Decrement cursor (shift cursor to left)
6	Increment cursor (shift cursor to right)
5	Shift display right
7	Shift display left
8	Display off, cursor off
A	Display off, cursor on
C	Display on, cursor off
E	Display on, cursor blinking

F	Display on, cursor blinking
10	Shift cursor position to left
14	Shift cursor position to right
18	Shift the entire display to the left
1C	Shift the entire display to the right
80	Force cursor to beginning of 1st line
C0	Force cursor to beginning of 2nd line
28	2 lines and 5 × 7 matrix (D4–D7, 4-bit)
38	2 lines and 5 × 7 matrix (D0–D7, 8-bit)

*Note:* This table is extracted from Table 12-4.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

In this section you will see how to interface an LCD to the AVR in two different ways.

We can use 8-bit data or 4-bit data options.

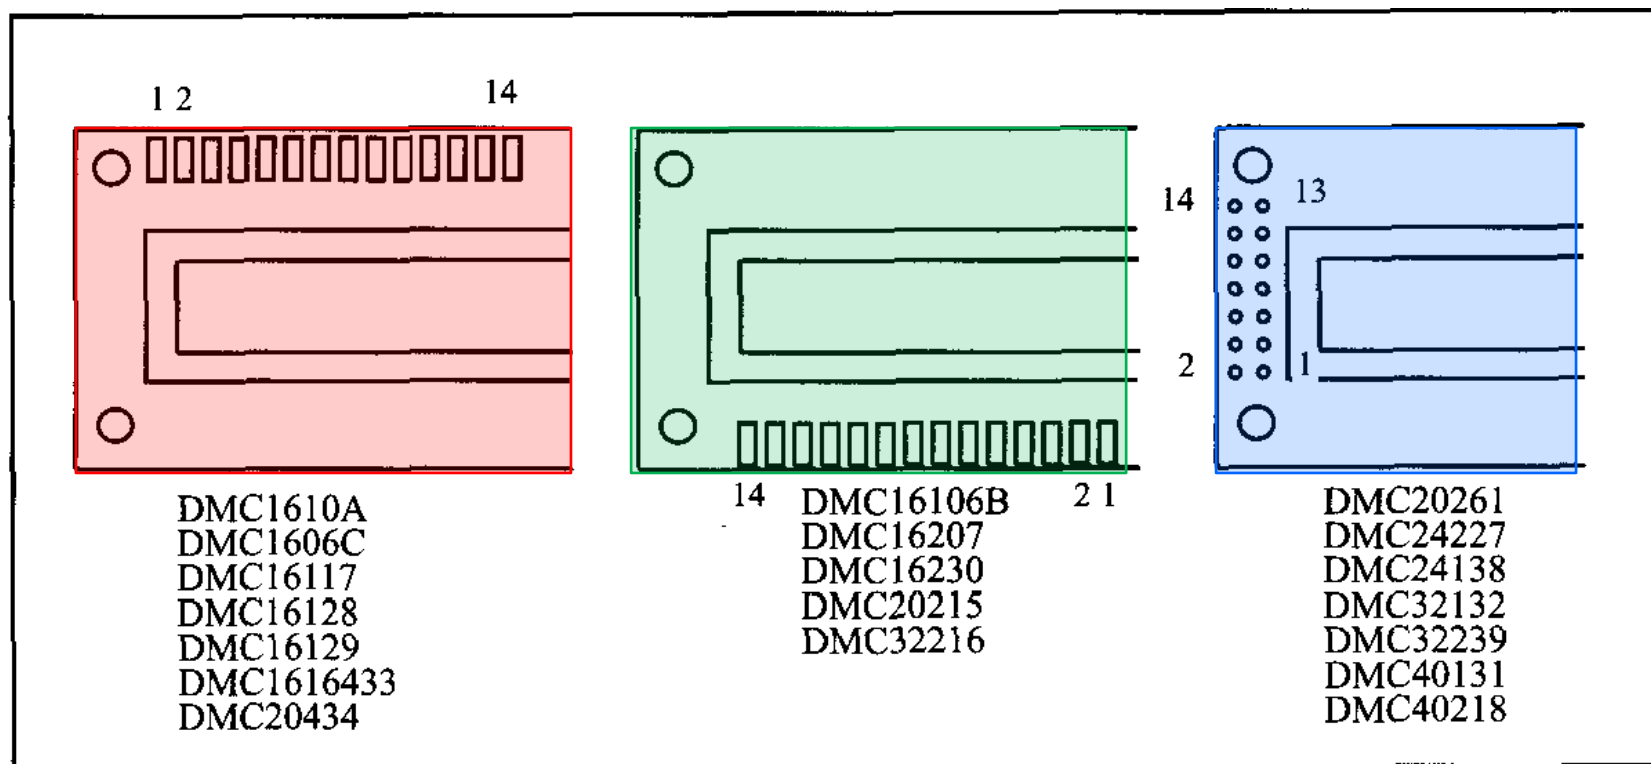

The 8-bit data interfacing is easier to program but uses 4 more pins.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

Dot matrix character LCDs are available in different packages. The Figure shows the position of each pin in different packages.

**Figure 12-1. Pin Positions for Various LCDs from Optrex**

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### **Sending commands and data to LCDs**

To send data and commands to LCDs you should do the following steps.  
Notice that steps 2 and 3 can be repeated many times:

1. Initialize the LCD.
2. Send any of the commands from Table 12-2 to the LCD.
3. Send the character to be shown on the LCD.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### Initializing the LCD

To initialize the LCD for 5 x 7 matrix and 8-bit operation, the following sequence of commands should be sent to the LCD:

**0x38, 0x0E, and 0x01.**

Next we will show how to send a command to the LCD. After power-up you should wait about 15ms before sending initializing commands to the LCD. If the LCD initializer function is not the first function in your code you can omit this delay.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### Sending commands to the LCD

To send any of the commands from Table 12-2 to the LCD, make pins RS and R/W=0 and put the command number on the data pins (D0-D7). Then send a high-to-low pulse to the E pin to enable the internal latch of the LCD.

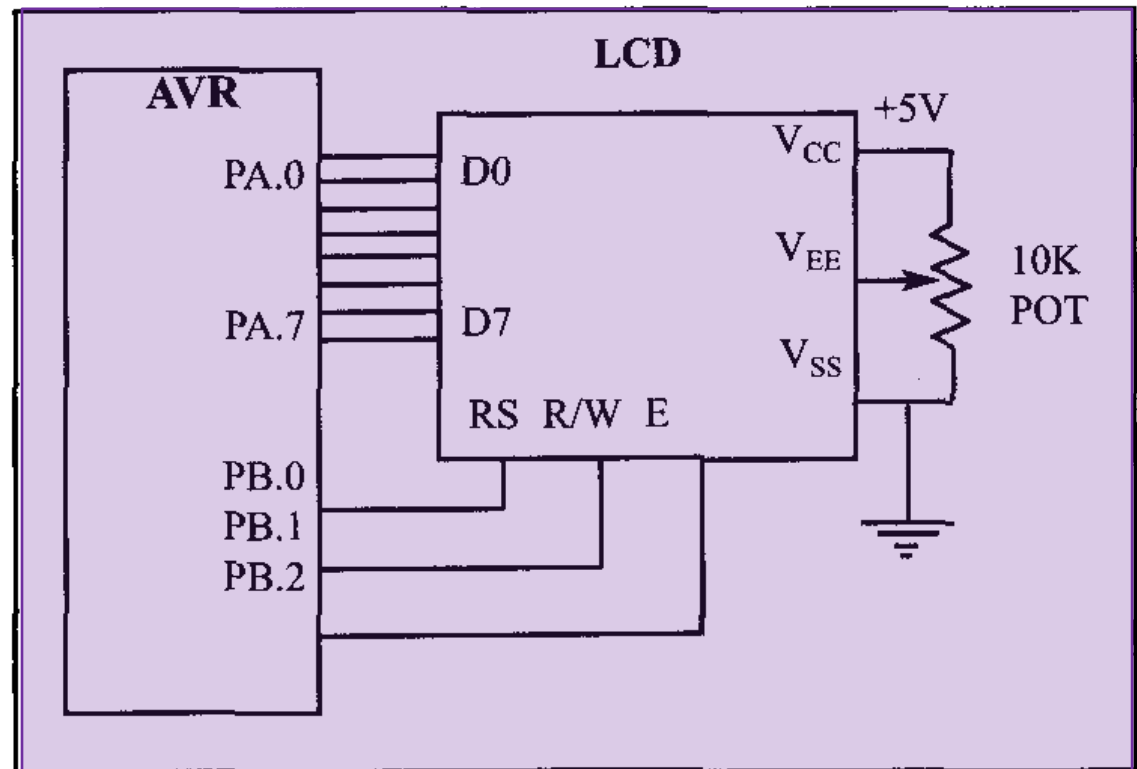

Notice that after each command you should wait about  $100\mu\text{s}$  to let the LCD module run the command. Clear LCD and Return Home commands are exceptions to this rule. After the 0x01 and 0x02 commands you should wait for about 2 ms. Table 12-3 shows the details of commands and their execution times.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### Sending data to the LCD

To send data to the LCD, make pins RS=1 and R/W=0. Then put the data on the data pins (D0-D7) and send a high-to-low pulse to the E pin to enable the internal latch of the LCD. Notice that after sending data you should wait about 100 $\mu$ s to let the LCD module write the data on the screen.

**Figure 12-2. LCD Connections for 8-bit Data**

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

Program 12-1 shows how to write "Hi" on the LCD using 8-bit data. The AVR connection to the LCD for 8-bit data is shown in Figure of previous slide.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

### Sending code or data to the LCD 4 bits at a time

The LCD may be forced into the 4-bit mode as shown in Program 12-2. Notice that its initialization differs from that of the 8-bit mode and that data is sent out on the high nibble of Port A, high nibble first. In 4-bit mode, we initialize the LCD with the series 33,32, and 28 in hex. This represents nibbles 3, 3, 3, and 2, which tells the LCD to go into 4-bit mode.

**Figure 12-3. LCD Connections Using 4-bit Data**

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

The value \$28 initializes the display for 5x7 matrix and 4-bit operation as required by the LCD datasheet. The write routines (CMNDWRT and DATAWRT) send the high nibble first, then swap the low nibble with the high nibble before it is sent to data pins D4-D7.

## 12.1 LCD INTERFACING

### Sending information to LCD using the LPM instruction

Program 12-4 shows how to use the LPM instruction to send a long string of characters to an LCD. Program 12-4 shows only the main part of the code. The other functions do not change. If you want to use a single port you have to change the port definition in the beginning of the code according to Program 12-2.

```
.INCLUDE "M32DEF.INC"
.EQU    LCD_DPRT = PORTA           ;LCD DATA PORT
.EQU    LCD_DDDR = DDRA            ;LCD DATA DDR
.EQU    LCD_DPIN = PINA            ;LCD DATA PIN
.EQU    LCD_CPRT = PORTB           ;LCD COMMAND PORT
.EQU    LCD_CDDR = DDRB            ;LCD COMMANDS DDR
.EQU    LCD_CPIN = PINB            ;LCD COMMANDS PIN
.EQU    LCD_RS = 0                 ;LCD RS
.EQU    LCD_RW = 1                 ;LCD RW
.EQU    LCD_EN = 2                 ;LCD EN

## 12.1 LCD INTERFACING

### LCD data sheet

Here we deepen your understanding of LCDs by concentrating on **two important concepts**.

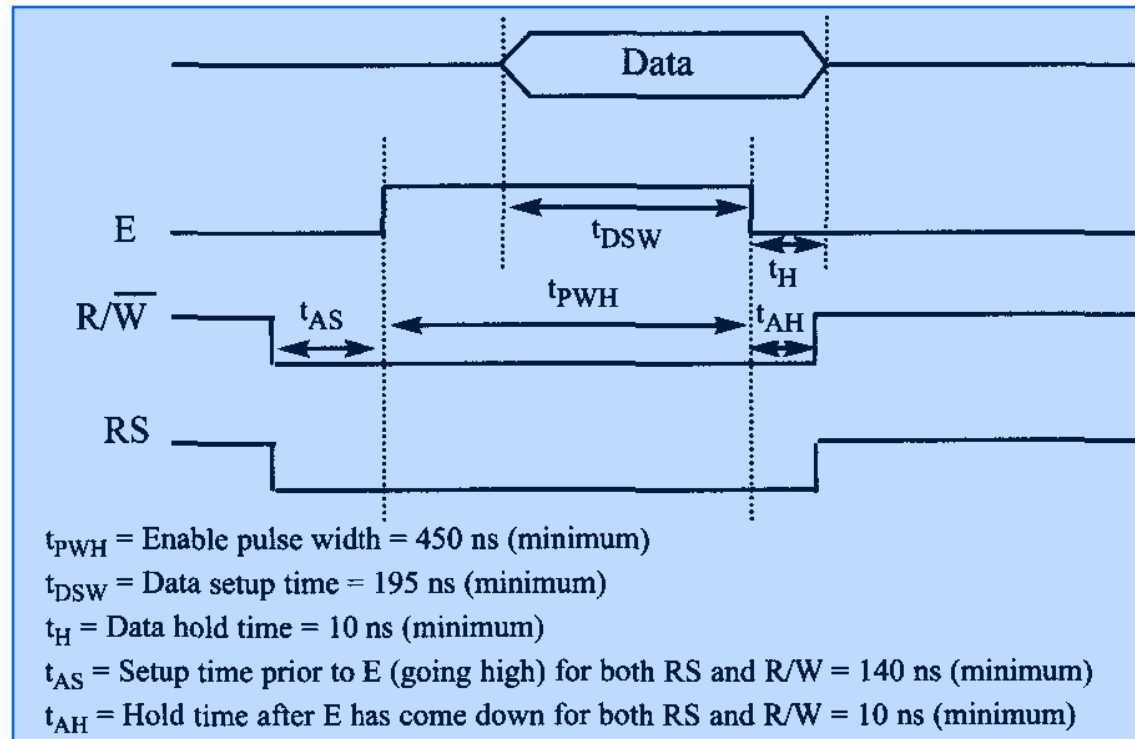

First we will show you the timing diagram of the LCD;  
then we will discuss how to put data at any location.

### LCD timing diagrams

In Figures 12-5 and 12-6 you can study and contrast the Write timing for the 8-bit and 4-bit modes. Notice that in the 4-bit operating mode, the high nibble is transmitted. Also notice that each nibble is followed by a high-to-low pulse to enable the internal latch of the LCD.

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

**Figure 12-5. LCD Timing for Write (H-to-L for E line)**

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

Notice that in the 4-bit operating mode, the high nibble is transmitted. Also notice that each nibble is followed by a high-to-low pulse to enable the internal latch of the LCD.

## 12.1 LCD INTERFACING

### LCD programming in C

Programs 12-5, 12-6, and 12-7 show how to interface an LCD to the AVR using C programming. The codes are modular to improve code clarity.

Program 12-5 shows how to use 8-bit data to interface an LCD to the AVR in C language.

```
//YOU HAVE TO SET THE CPU FREQUENCY IN AVR STUDIO
// BECAUSE YOU ARE USING PREDEFINED DELAY FUNCTION

#include <avr/io.h>                //standard AVR HEADER
#include <avr/delay.h>             //delay header

#define LCD_DPRT      PORTA        //LCD DATA PORT
#define LCD_DDDR      DDRA         //LCD DATA DDR
#define LCD_DPIN      PINA         //LCD DATA PIN
#define LCD_CPRT      PORTB        //LCD COMMAND PORT
#define LCD_CDDR      DDRB         //LCD COMMAND DDR
#define LCD_CPIN      PINB         //LCD COMMAND PIN
#define LCD_RS         0           //LCD RS
#define LCD_RW         1           //LCD RW
#define LCD_EN         0           //LCD EN
```

# LCD AND KEYBOARD INTERFACING

## 12.1 LCD INTERFACING

```
/** *****

```

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Interfacing the keyboard to the AVR

At the lowest level, keyboards are organized in a matrix of rows and columns. The CPU accesses both rows and columns through ports; therefore, with two 8-bit ports, an 8x8 matrix of keys can be connected to a microcontroller.

When a key is pressed, a row and a column make a contact; otherwise, there is no connection between rows and columns.

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Scanning and identifying the key

The rows are connected to an output port and the columns are connected to an input port.

If no key has been pressed, reading the input port will yield 1s for all columns since they are all connected to high (VCC).

If all the rows are grounded and a key is pressed, one of the columns will have 0 since the key pressed provides the path to ground.

Figure 12-7. Matrix Keyboard Connection to Ports

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Grounding rows and reading the columns

To detect a pressed key, the microcontroller grounds all rows by providing 0 to the output latch, and then it reads the columns.

If the data read from the columns is  $D3-D0=1111$ , no key has been pressed and the process continues until a key press is detected.

However, if one of the column bits has a zero, this means that a key press has occurred. For example, if  $D3-D0 = 1101$ , this means that a key in the D1 column has been pressed.

After a key press is detected, the microcontroller will go through the process of identifying the key.

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Grounding rows and reading the columns

Starting with the top row, the microcontroller grounds it by providing a low to row D0 only; then it reads the columns.

If the data read is all 1s, no key in that row is activated and the process is moved to the next row.

It grounds the next row, reads the columns, and checks for any zero. This process continues until the row is identified.

After identification of the row in which the key has been pressed, the next task is to find out which column the pressed key belongs to. This should be easy since the microcontroller knows at any time which row and column are being accessed. Look at Example 12-2.

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Example 12-2

From Figure 12-7 identify the row and column of the pressed key for each of the following.

(a)  $D3-D0 = 1110$  for the row,  $D3-D0 = 1011$  for the column

(b)  $D3-D0 = 1101$  for the row,  $D3-D0 = 0111$  for the column

### Solution:

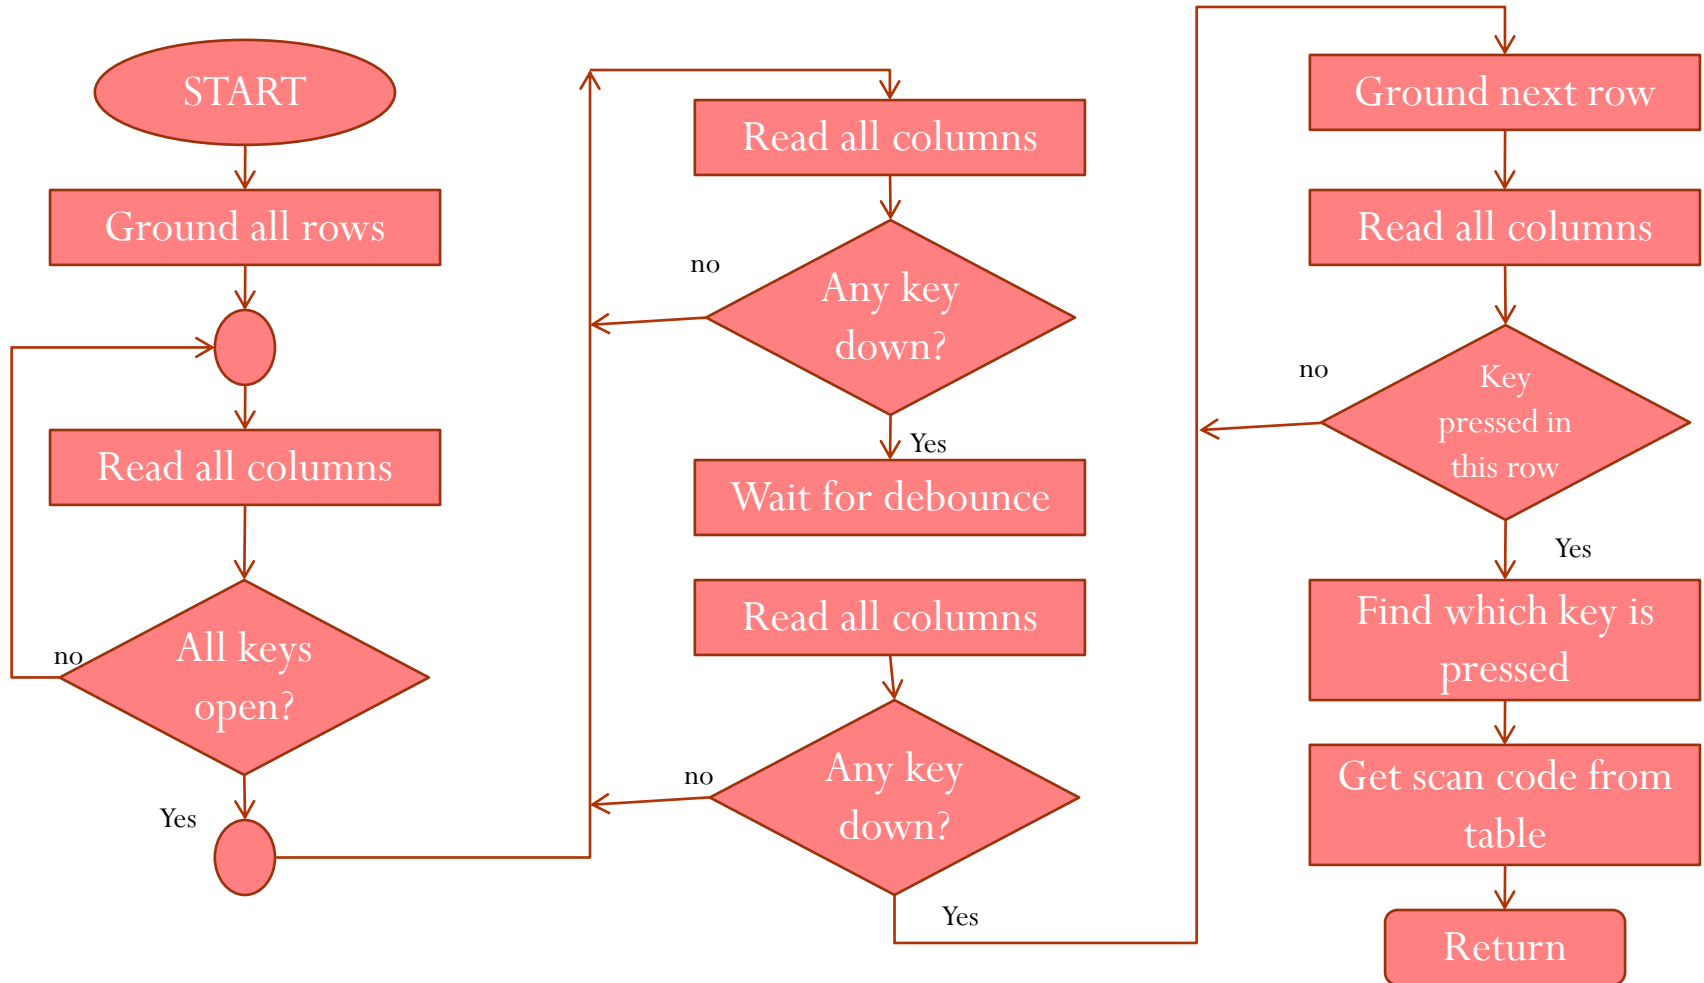

From Figure 12-7 the row and column can be used to identify the key.

(a) The row belongs to D0 and the column belongs to D2; therefore, key number 2 was pressed.

(b) The row belongs to D1 and the column belongs to D3; therefore, key number 7 was pressed.

## 12.2 KEYBOARD INTERFACING

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

Program 12-8 goes through the following four major stages (Figure 12-8 flowcharts this process):

1. To make sure that the preceding key has been released, 0s are output to all rows at once, and the columns are read and checked repeatedly until all the columns are high. When all columns are found to be high, the program waits for a short amount of time before it goes to the next stage of waiting for a key to be pressed.

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

2. To see if any key is pressed, the columns are scanned over and over in an infinite loop until one of them has a 0 on it. Remember that the output latches connected to rows still have their initial zeros, making them grounded. After the key press detection, the microcontroller waits 20 ms for the bounce and then scans the columns again. This serves two functions: (a) it ensures that the first key press detection was not an erroneous one due to a spike noise, and (b) the 20-ms delay prevents the same key press from being interpreted as a multiple key press. Look at Figure 12-9. If after the 20-ms delay the key is still pressed, it goes to the next stage to detect which row it belongs to; otherwise, it goes back into the loop to detect a real key press.

### Figure 12-9. Keyboard Debounce

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

3. To detect which row the key press belongs to, the microcontroller grounds one row at a time, reading the columns each time. If it finds that all columns are high, this means that the key press cannot belong to that row; therefore, it grounds the next row and continues until it finds the row the key press belongs to. Upon finding the row that the key press belongs to, it sets up the starting address for the look-up table holding the scan codes (or the ASCII value) for that row and goes to the next stage to identify the key.

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

4. To identify the key press, the microcontroller rotates the column bits, one bit at a time, into the carry flag and checks to see if it is low. Upon finding the zero, it pulls out the ASCII code for that key from the look-up table; otherwise, it increments the pointer to point to the next element of the look-up table.

While the key press detection is standard for all keyboards, the process for determining which key is pressed varies. The look-up table method shown in Program 12-8 can be modified to work with any matrix up to 8 x 8. Example 12-3 shows keypad programming in C.

## 12.2 KEYBOARD INTERFACING

### Example 12-3

Write a C program to read the keypad and send the result to Port D.

PC0-PC3 connected to columns

PC4-PC7 connected to rows

```
#include <avr/io.h>
#include <util/delay.h>
#define KEY_PRT PORTC
#define KEY_DDRC DDRC
#define KEY_PIN PINC

Void delay_ms(unsigned int d)
{
    _delay_ms(d);
}

Unsigned char keypad[4][4]={'0','1','2','3',
                           '4','5','6','7',
                           '8','9','A','B',
                           'C','D','E','F'};
```

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Example 12-3

```
Void main(void)
{
    unsigned char colloc,rowloc;
    //keyboard routine. This sends the ASCII code
    //for pressed key to port c
    DDRD = 0xFF;
    KEY_DDR = 0xF0;
    KEY_PRT = 0xFF;
    While(1)
    {
        do
        {
            KEY_PRT &= 0x0F;           //ground all rows at once
            colloc = (KEY_PIN & 0x0F); //read the columns
            while(colloc != 0X0f);      //check until all keys released
        }
    }
}
```

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Example 12-3

```
do
{
    do
    {
        delay_ms(20);
        colloc = (KEY_PIN & 0x0F);           //see if any key is pressed
        }
        while(colloc == 0x0F);               //keep checking for key press
        delay_ms(20);                       //call delay for debounce
        colloc = (KEY_PIN & 0x0F);           //read all columns
    }
    while(colloc == 0x0F);                   //wait for key press
while(1)
{
    KEY_PRT = 0xEF;                         //ground row 0
    colloc = (KEY_PIN & 0X0F);               //read the columns
    if(colloc != 0x0F)                      //column detected
    {
        rowloc = 0;                        //save row location
        break;
    }
}
```

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Example 12-3

```
        KEY_PRT = 0xDF;           //ground row 1
colloc = (KEY_PIN & 0X0F);        //read the columns
if(colloc != 0x0F)                //column detected
{
    rowloc = 1;                   //save row location
    break;
}

        KEY_PRT = 0xBF;           //ground row 2
colloc = (KEY_PIN & 0X0F);        //read the columns
if(colloc != 0x0F)                //column detected
{
    rowloc = 2;                   //save row location
    break;
}

        KEY_PRT = 0x7F;           //ground row 3
colloc = (KEY_PIN & 0X0F);        //read the columns
rowloc = 3;                       //save row location
break;
}
```

# LCD AND KEYBOARD INTERFACING

## 12.2 KEYBOARD INTERFACING

### Example 12-3

```
//check column and send result to Port D
if(colloc == 0x0E)
    PORTD = (KEYPAD[ROWLOC][0];
else if(colloc == 0x0D)
    PORTD = (KEYPAD[ROWLOC][1];
else if(colloc == 0x0B)
    PORTD = (KEYPAD[ROWLOC][2];
else
    PORTD = (KEYPAD[ROWLOC][3];
}
return 0;
}
```
